According to the ONFP procedure, clones giving the same hybridisation pattern with a battery of 200 Smer oligonucleotides are grouped into clusters. One clone per cluster is selected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well the coordinates of the rest of the clones assigned to the same fingerprint cluster as the clone from which the above EST is generated is available at the amphioxus project site at http://www.molgen.mpg.de/amphioxus/Clones and filers are distributed via the Resource Center/Primary Database of the German Genome Project (http://www.rzpd.de)

                                                                                                                                   The library was characterised by oligonucleotide fingerprinting (ONPP) to reduce sequencing redundancy. According to the ONPP procedure, clones giving the same hybridisation pattern with a battery of 200 8mer oligonucleotides are grouped into clusters. One clone per cluster is selected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well the coordinates of the rest of the clones assigned to the same fingerprint cluster as the clone from which the above EST is generated is available at the amphioxus project site at: http://www.molgen.mpg.de/amphioxus/Clones and filters are distributed via the Resource Center/Primary companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Panopoulou,G., Hennig,S., Groth,D., Krause,A., Poustka,A.J

According to the ONFP procedure, clones giving the same hybridisation pattern with a battery of 200 8mer oligonucleotides are grouped into clusters. One clone per cluster is selected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well the coordinates of the rest of the clones assigned to the same fingerprint cluster as the clone from which the above EST is generated is available at the amphioxus project site at: http://www.molgen.mpg.de/amphioxus/clones and filters are distributed via the Resource Center/Primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   laboratory 145, dept.Lehrach

The library was characterised by oligonucleotide fingerprinting

(ONFP) to reduce sequencing redundancy. According to the ONFP

procedure, clones giving the same hybridisation pattern with a

battery of 200 8mer oligonucleotides are grouped into clusters. One

clone per cluster is selected for sequencing. The size of each

cluster is an indicator of the frequency of a transcript in the

analysed library. The cluster size as well the coordinates of the

rest of the clones assigned to the same fingerprint cluster as the

clone from which the above EST is generated is available at the

amphioxus project site at: http://www.molgen.mpg.de/amphioxus/

Clones and filers are distributed via the Resource Center/Primary

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                       Score

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
